

PSD2Outbound GCO Alert - GKE Node Memory Utilization

PSD2Outbound GCO Alert - GKE Node Memory Utilization

Why do we have this alert?

- This alert is to inform support team that Memory utilization of the GKE Node is reached to its peak value.

What does this alert mean?

- This means GKE node has consumed higher memory and there is less space remained in memory.

Impact to customer

- Requests may get fails with out of memory error if no action taken.

Investigation Steps

Please take below scenarios into consideration while investigating high memory utilization.

Workload Resource Requests and Limits:

Ensure that your workloads have appropriate memory resource requests and limits defined. If memory requests are too low, it can lead to high memory usage. Adjust the resource requests based on your application's requirements.

Inefficient Workloads:

Poorly optimized applications or inefficient code can consume excessive memory. Profile your workloads to identify memory bottlenecks and optimize them.

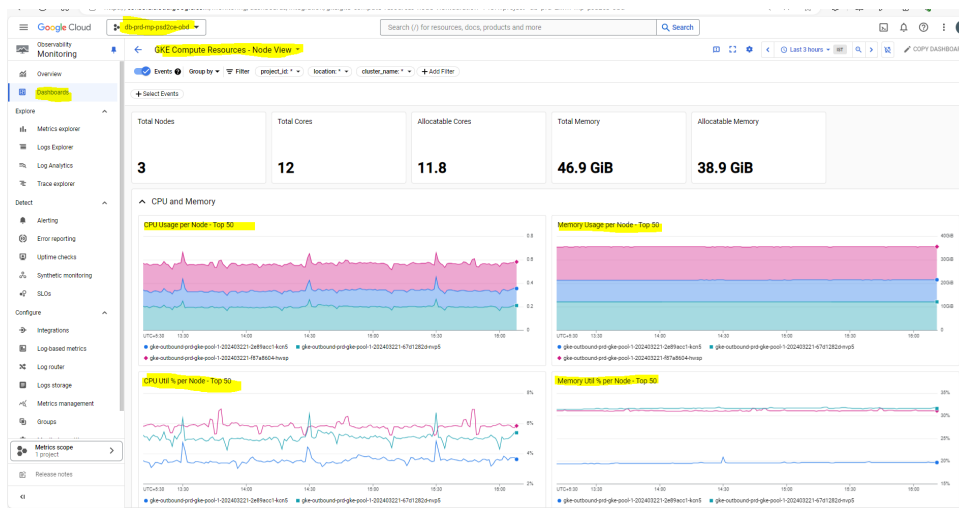

Memory Leaks:

Memory leaks occur when an application fails to release memory after it's no longer needed. Monitor your application for memory leaks using tools like the Google Cloud Console.

OOM (Out of Memory) Events:

Pods may be terminated due to memory pressure if they exceed their memory limits. Check for OOM events in the Kubernetes events log.

- Also Click on the URL given in this alert notification to check the logs and try to find out the exact reason for the high memory usage.

Remediation steps

- Once you find the relevant logs share it with dev team to get the more details and remediate this issue.
- Please refer contact details in additional information section.

Additional Information

RTB contact details : psd2.rtb@list.db.com

Verification Steps

- Go to GKE Console -> Dashboard -> Pick the Dashboard -> Check Memory usage graph.
- Verify the Memory has dropped below the alert threshold and remains stable over time.
- Check the logs to confirm there are no new OOM Error in the logs.
