

PSD2Outbound GCO Alert - Latency Alert

Latency Alert

Why do we have this alert?

- This alert helps to identify high response time for all individual microservices in NAR2.

What does this alert mean?

- This alert is triggered if response time of any of the microservice is more than usual in last 15 mins.

Impact to customer

- If response time is higher for microservices, than customer may experience slowness or even timeouts for their requests.

Investigation Steps

- We can initiate the analysis by retrieving the CAID from GCP logs. Once obtained, determine the type of request based on the CAID prefix:
 - If the CAID begins with PBDECOFI, it indicates a CoFi request
 - If the CAID begins with MMDEOPRA, it signifies an MnM request.
- For both types, follow these steps:
- Check the logs related to the CAID in Google Logs Explorer or query the audit_log against the CAID in the database.
- Identify any failed events and assess whether the failure corresponds to a valid case, typically indicated by error code 400, or if there are other issues.
- Events with names starting with VOEB are associated with calls to Pegateq (the URL begins with <https://accounts.db.com/>).
- If calls are failing with status codes 401 or 408, contact the relevant team to investigate the cause of the failure.

Query

```
SELECT
  *
FROM
  xs2a_accounts_db.audit_log
WHERE
  credit_application_id = 'MMDEOPRA 345-11-00000000 250616-153535 00466319-7'
ORDER BY
  created_date_time;
```

Verification Steps

- Please verify that no failures observed once the required action taken after received an alert.
- Filter the request with different event_type,code for which the failures occurred earlier and verify that now the requests are processing fine for the same.

Query

```
SELECT
    *
FROM
    xs2a_accounts_db.audit_log
WHERE
    event_type in('','') and code='' --put the event type and error code for which failure were
observed.
ORDER BY
    created_date_time;
```

Verification Steps:

- Once alert is received ,check the request_id,CA_ID,audit_id and check MnM or Cofi requests failing in GCO alert.
- Then check at which event type giving error and for which bank its failing.
- Report this issue respective team,need to monitor closely whether issue resolved or not.
- For that we need to check in Database latest success request.
- check requests for that particular bank success or not.
