

PSD2Outbound GCO Alert - Query Execution Time

PSD2Outbound GCO Alert - Query Execution Time

Why do we have this alert?

- To get to know if there is any query which taking more than usual time.

What does this alert mean?

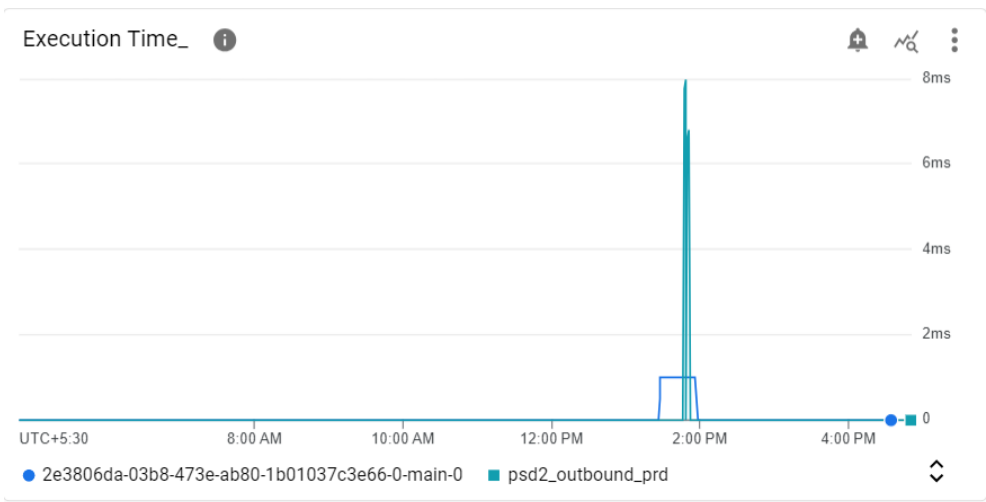

- Accumulated execution times per user per database per query. This is the sum of cpu time, io wait time, lock wait time, process context switch, and scheduling for all the processes involved in the query execution.

Impact to customer

- If there is a long running query for more than expected time it may affect the database performance.

Investigation Steps

- Go to google cloud console
- Navigate to Monitoring >> Dashboards
- Open Golden Signal - Saturation - Database dashboard and check Execution time widget. [Golden Signal - Saturation - Database – Monitoring – db-prd-mp-psd2ce-obd – Google Cloud console](#)

- Query details can be view from Query insights as well([psd2ce-outbound-db – Query insights – SQL – db-dev-psd2ce-obd – Google Cloud console](#))

Top queries and tags

An overview of the queries and tags that cause the most database load within the data and time range currently selected. For a closer look at a specific query's details, select one. [Learn more](#)
