

PSD2Outbound GCO Alert- Java Null Pointer Exception

PSD2Outbound GCO Alert-Java Null Pointer Exception

Why do we have this alert?

- To ensure the microservices are running successfully without data issue

What does this alert mean?

- Null Pointer Exception is a kind of run time exception that is thrown when the java program attempts to use the object reference that contains the null value.

Impact to customer-

- Customer would receive 4xx error from the response with valid Error code and description .

Investigation Steps-

- Once you get this alert then go to GCP logs and search for the keyword "**NullPointerException**" [Sample screenshot given below] and try to find out the sample request ID's as well as the specific service for which these errors are triggered.

The screenshot displays the GCP Cloud Logging console. The search bar at the top contains the text "resource.type='k8s_container' resource.labels.namespace_name='psd2obd-microservice' (textPayload:'NullPointerException')". The left sidebar shows a filter tree with 'WORKLOAD / SERVICE' expanded to 'xsa2a-account-service' and 'RESOURCE TYPE' set to 'Kubernetes Container'. The main panel shows a timeline with two results. The first result, dated 2025-03-18 12:26:48.481, shows a stack trace for a NullPointerException in the 'com.db.pcb.banking.xsa2a.client.dto.XSA2AResponseMessage' class. The second result, dated 2025-03-18 12:27:05.896, shows a similar stack trace for a NullPointerException in the 'com.db.pcb.banking.xsa2a.client.dto.XSA2AResponseMessage' class.

- Once you get the above details share it with RTB Team for further investigation.
- Check the database to verify the impact of the issue and make sure whether the requests are flowing.
